CSCI 3060U - PROJECT AI USAGE HISTORY

Project: Digital Games Distribution System

Course: CSCI 3060U

Phase: Project Phases 1–3

Team: Sabre Inc.

Team Members :

Chris Ibrahim

Faraz Shaikh

Jesse Parker

Mir Mahdi Ali

Declaration

This document records Generative AI assistance used throughout our Digital Games Distribution System project. AI was used to help us understand assignment requirements, software design, C++ implementation concepts, automated testing, debugging, and submission preparation. The documented interactions reflect how AI supported our understanding and review of the project work.

AI Tool Used

Tool: ChatGPT

Approximate Date:

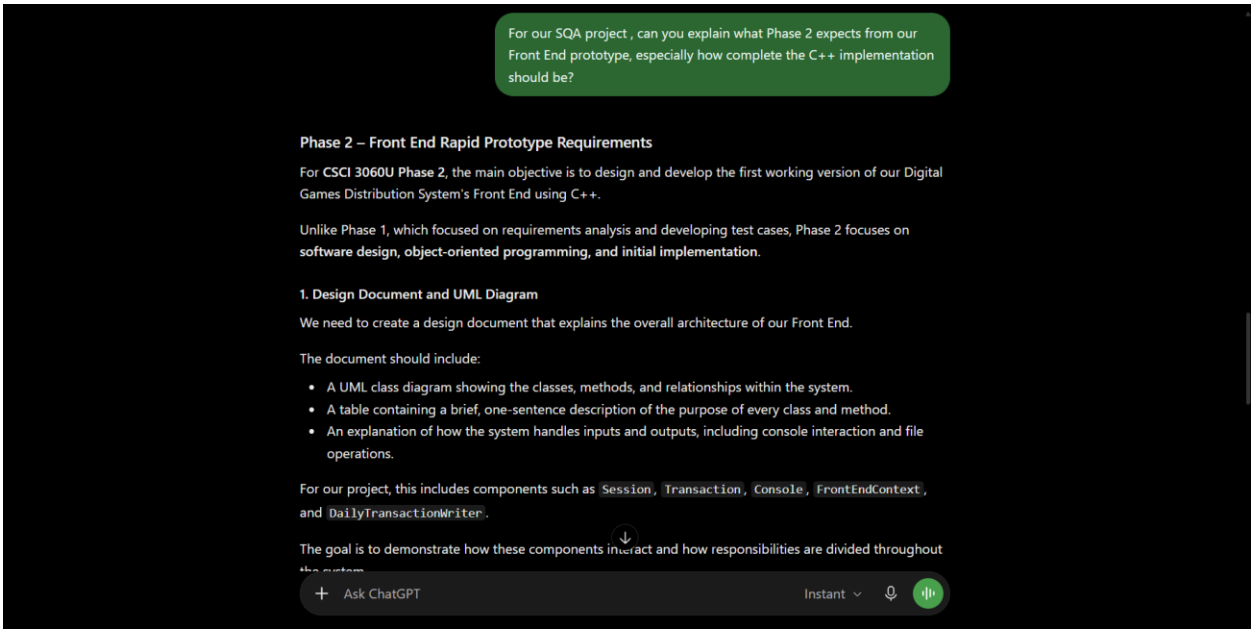

October-November 2026

Prompt History

Prompt 1 :

Can you explain what Phase 2 expects from our Front End prototype, especially how complete the C++ implementation should be?

ChatGPT Response:

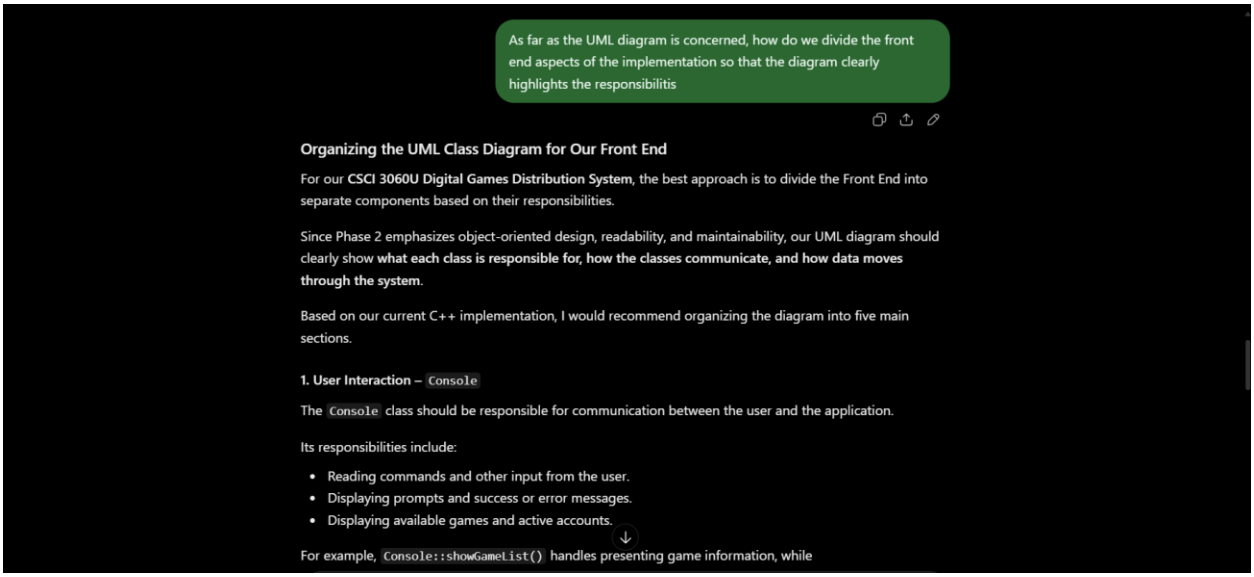

The rest of the screenshot goes onto explain various aspects of the project and grant us a better understanding of how much implementation is required , what all the required documents for submission , testing inputs , code quality and maintainability and to refer to the rubric while proceeding with the implementation

Prompt 2:

As far as the UML diagram is concerned, how do we divide the front end aspects of the implementation so that the diagram clearly highlights the responsibilitis ?

ChatGPT Response :

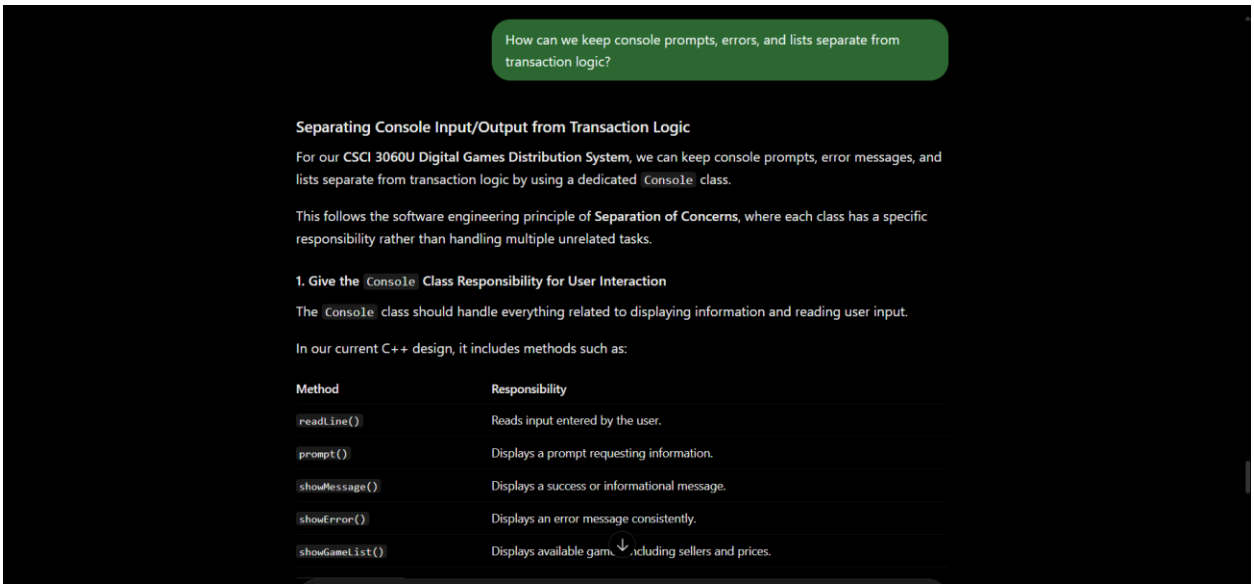

The rest of the response goes onto explain what each class of the UML diagram should show such as user interaction , session management, transaction processing etc while showing a small pictorial demo of how the UML diagram could look like

Prompt 3:

How can we keep console prompts, errors, and lists separate from transaction logic?

ChatGPT Response :

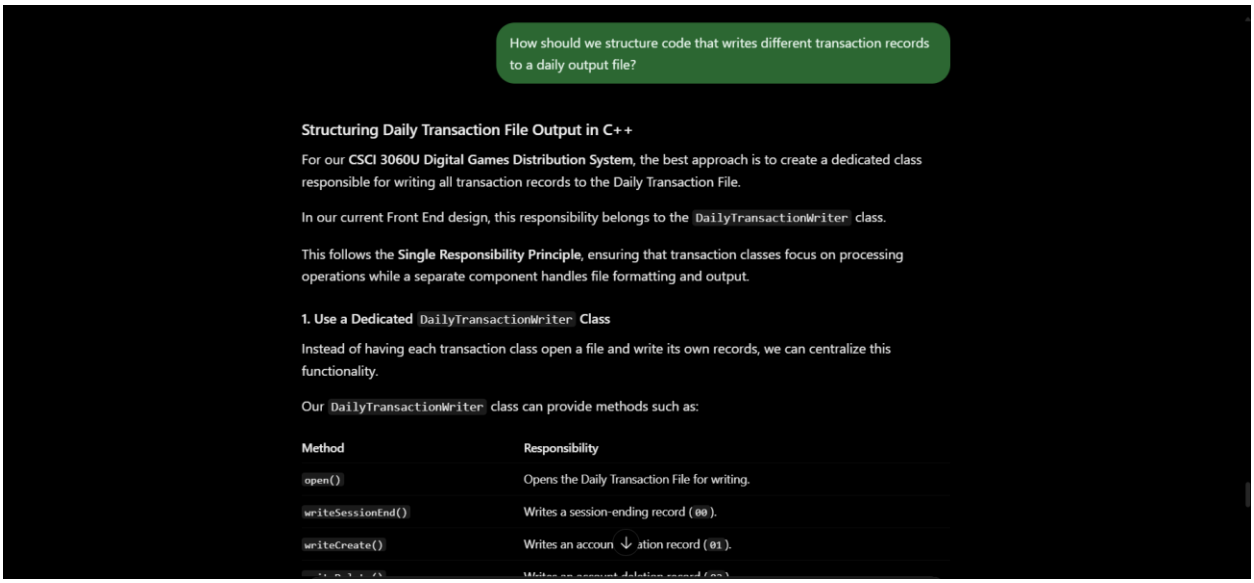

The rest of the response helps us understand the separation of concerns and goes onto explain how we should create a small Console interface for reading lines and printing messages, errors, game listings, and account listings and to keep formatting details out of transaction classes.

Prompt 4:

How should we structure code that writes different transaction records to a daily output file?

ChatGPT Response :

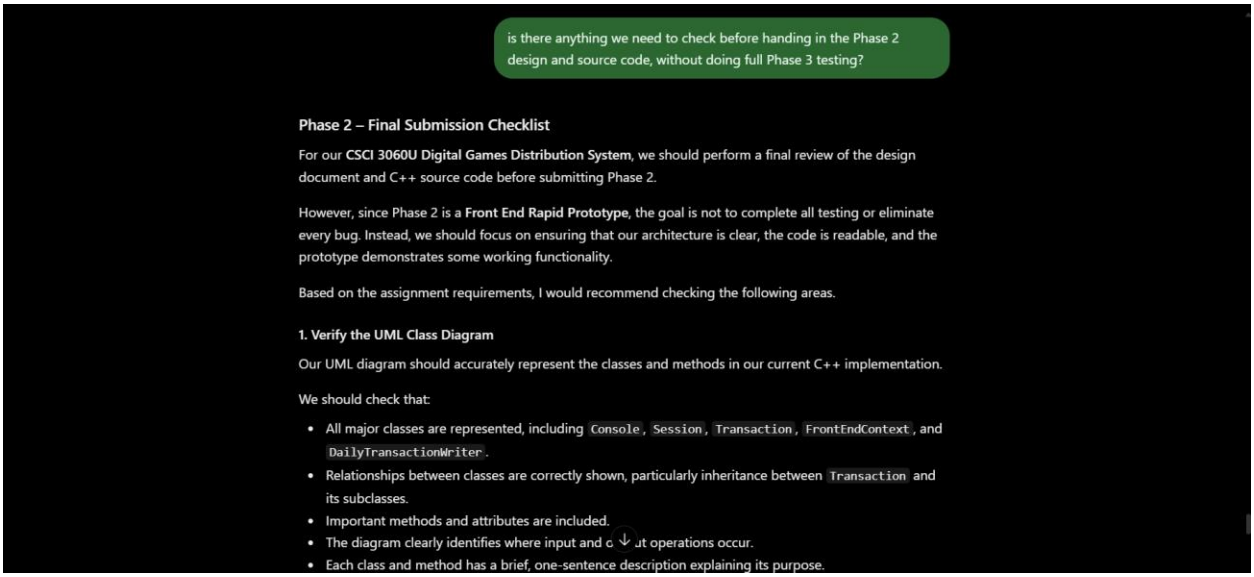

The response goes onto explain the best approach is to create a dedicated class with one method for each record type. It also explains how we should centralize widths, numeric precision, and file lifecycle handling so transactions do not duplicate formatting logic.

Prompt 5:

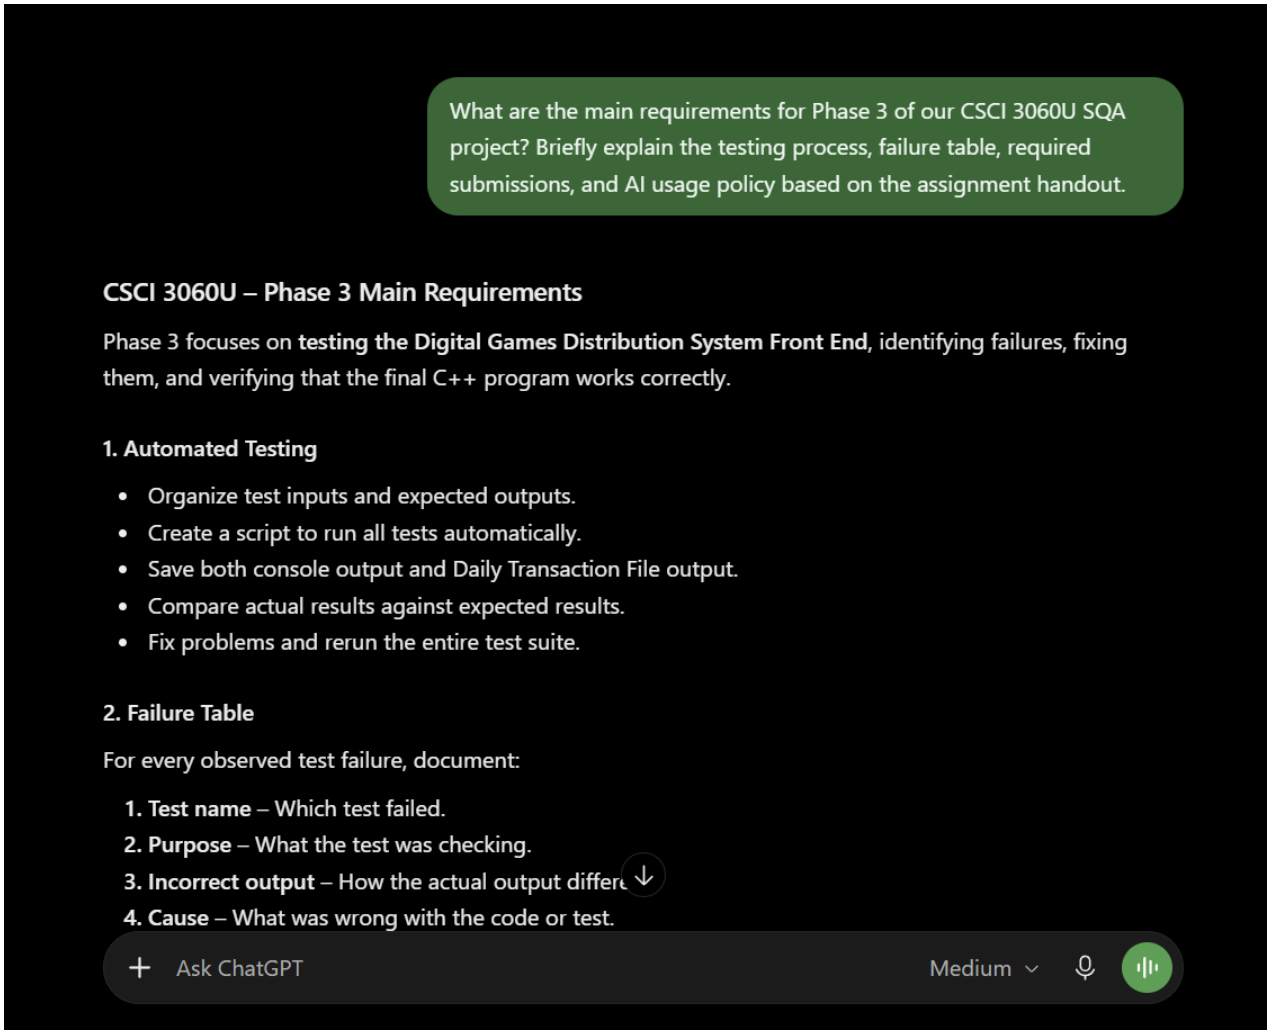

What should we check before handing in the Phase 2 design and source code, without doing full Phase 3 testing?

ChatGPT Response :

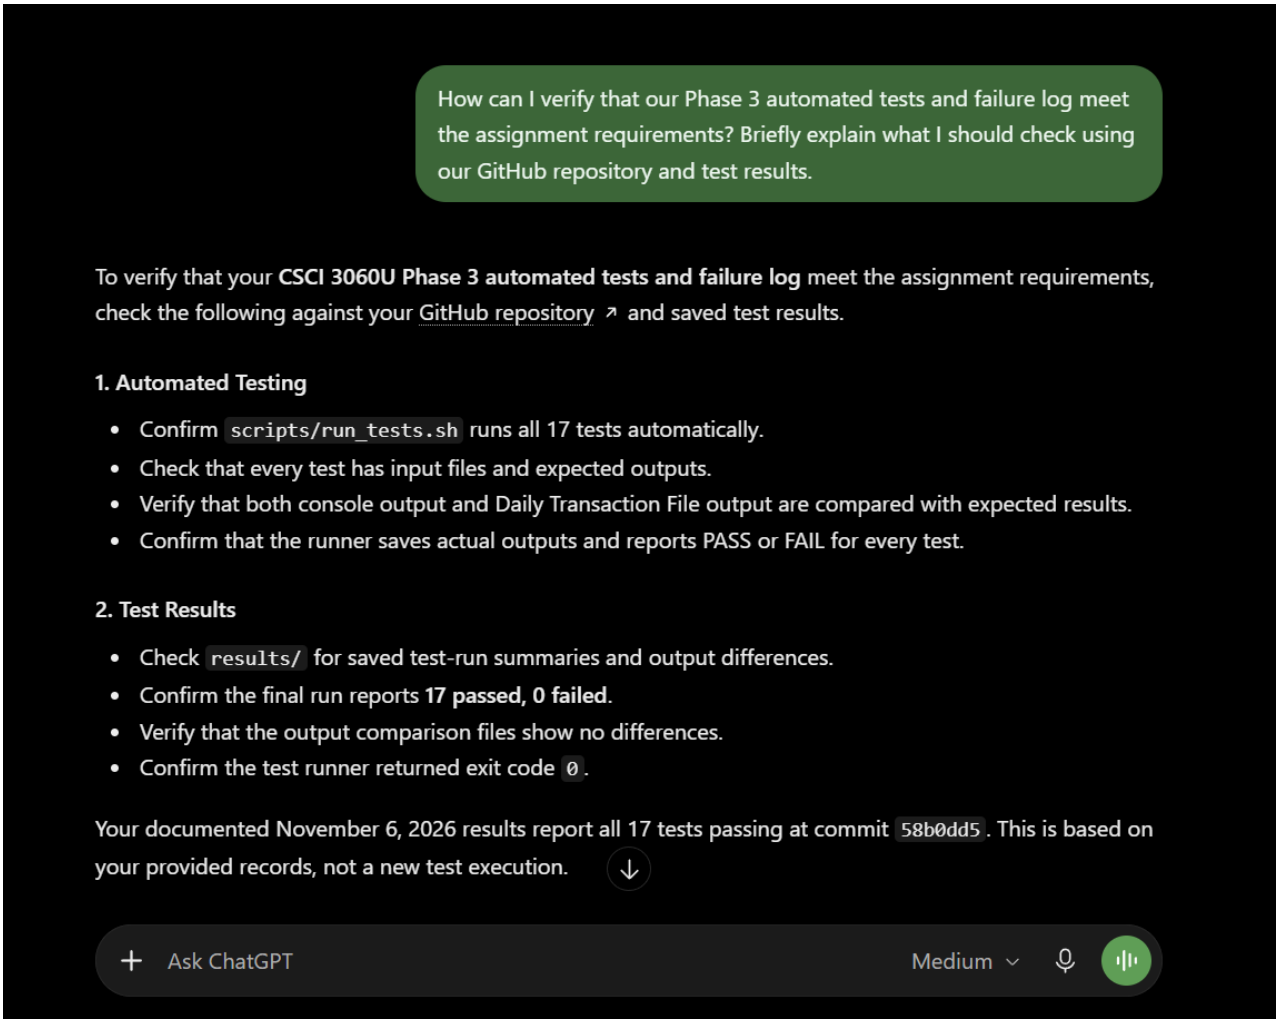

The response explained that we need to verify that the UML reflects the current code, every class and method has a short purpose description, input/output paths are identified, and source files are organized and committed.

Prompt 6:
What are the main requirements for Phase 3 of our CSCI 3060U SQA project? Briefly explain the testing process, failure table, required submissions, and AI usage policy based on the assignment handout.
Chatgpt response:

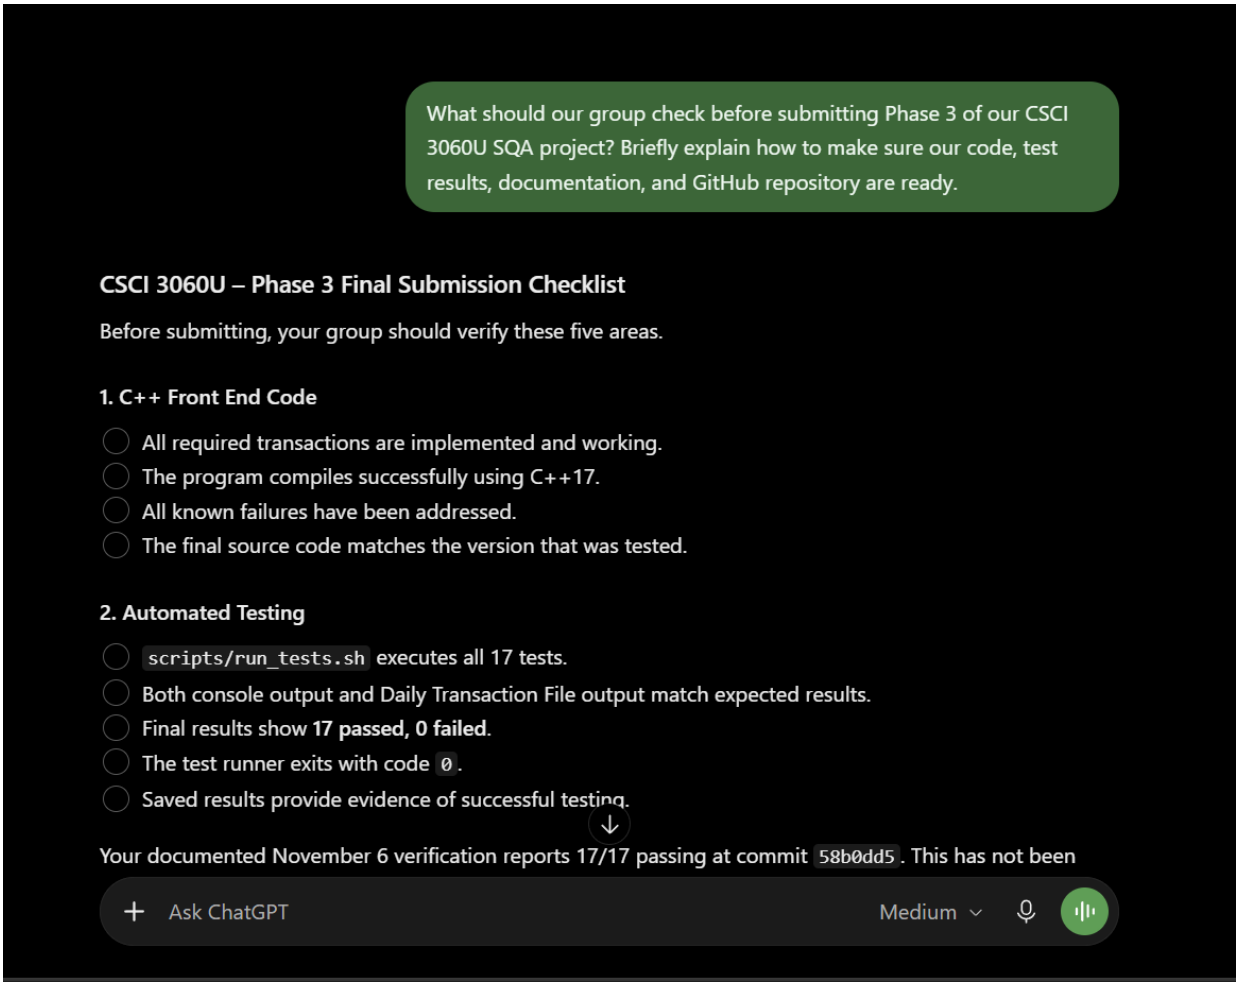

The rest of the response explains the main requirements of Phase 3, including organizing test cases, automating tests, comparing expected and actual outputs, and documenting failures and their fixes. It also outlines the required submission files, GitHub requirements, the Generative AI usage policy, and the November 7 deadline.

Prompt 7:
How can I verify that our Phase 3 automated tests and failure log meet the assignment requirements? Briefly explain what I should check using our GitHub repository and test results.
Chatgpt response:

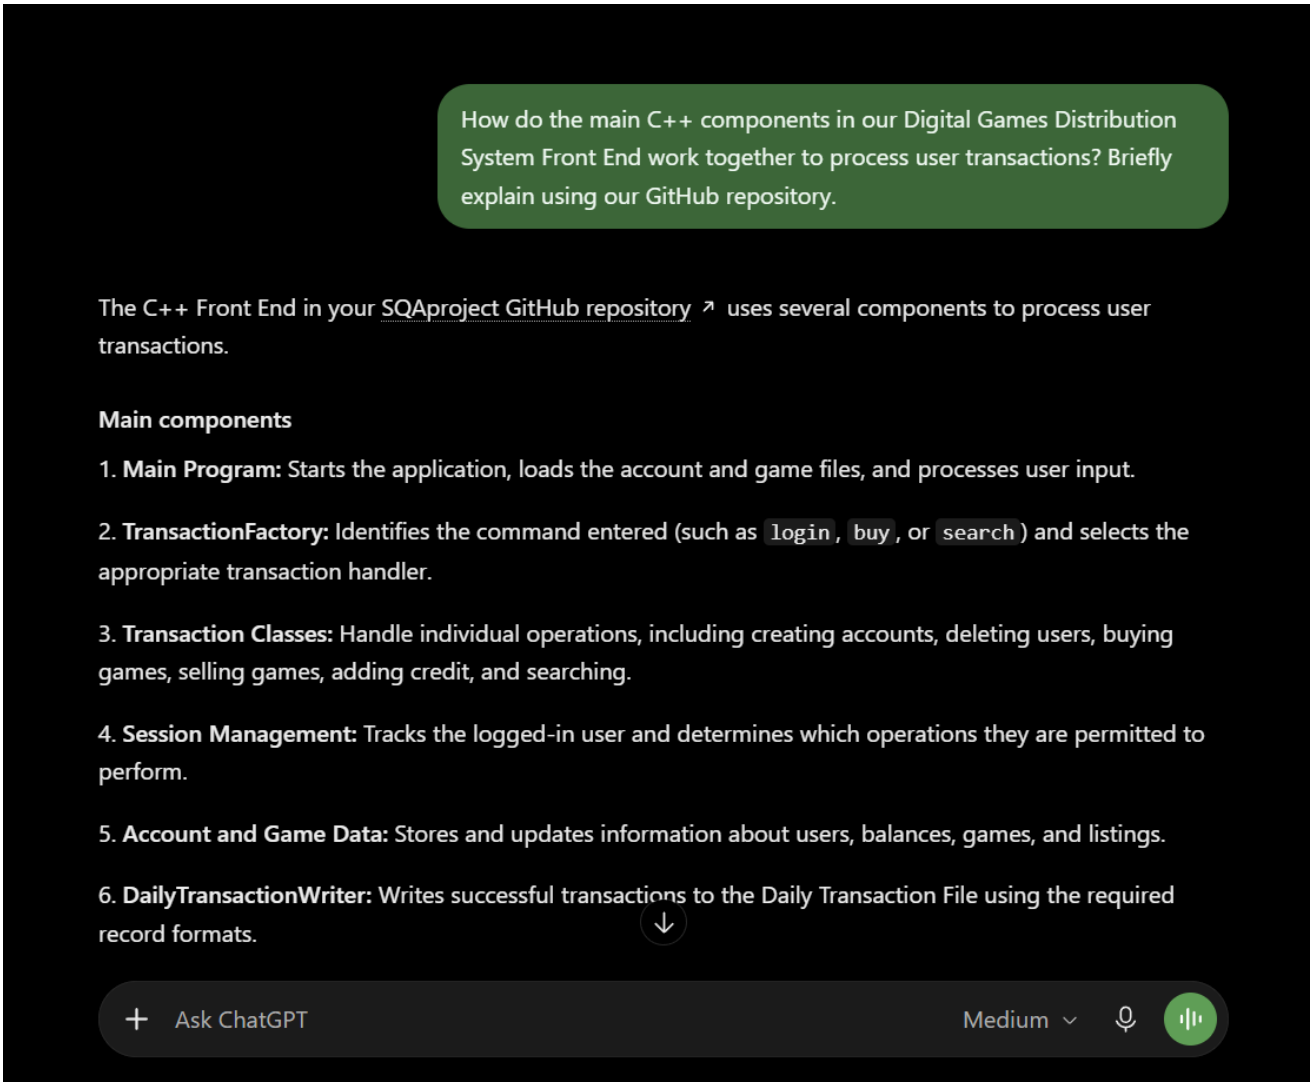

The rest of the response explains how to verify that automated tests compare actual and expected outputs, record test results, and identify failures. It also discusses checking that the failure log includes the five historical failures, their causes and fixes, and that the testing scripts and final results meet the assignment requirements.

Prompt 8:
What should our group check before submitting Phase 3 of our CSCI 3060U SQA project? Briefly explain how to make sure our code, test results, documentation, and GitHub repository are ready.
Chatgpt response:

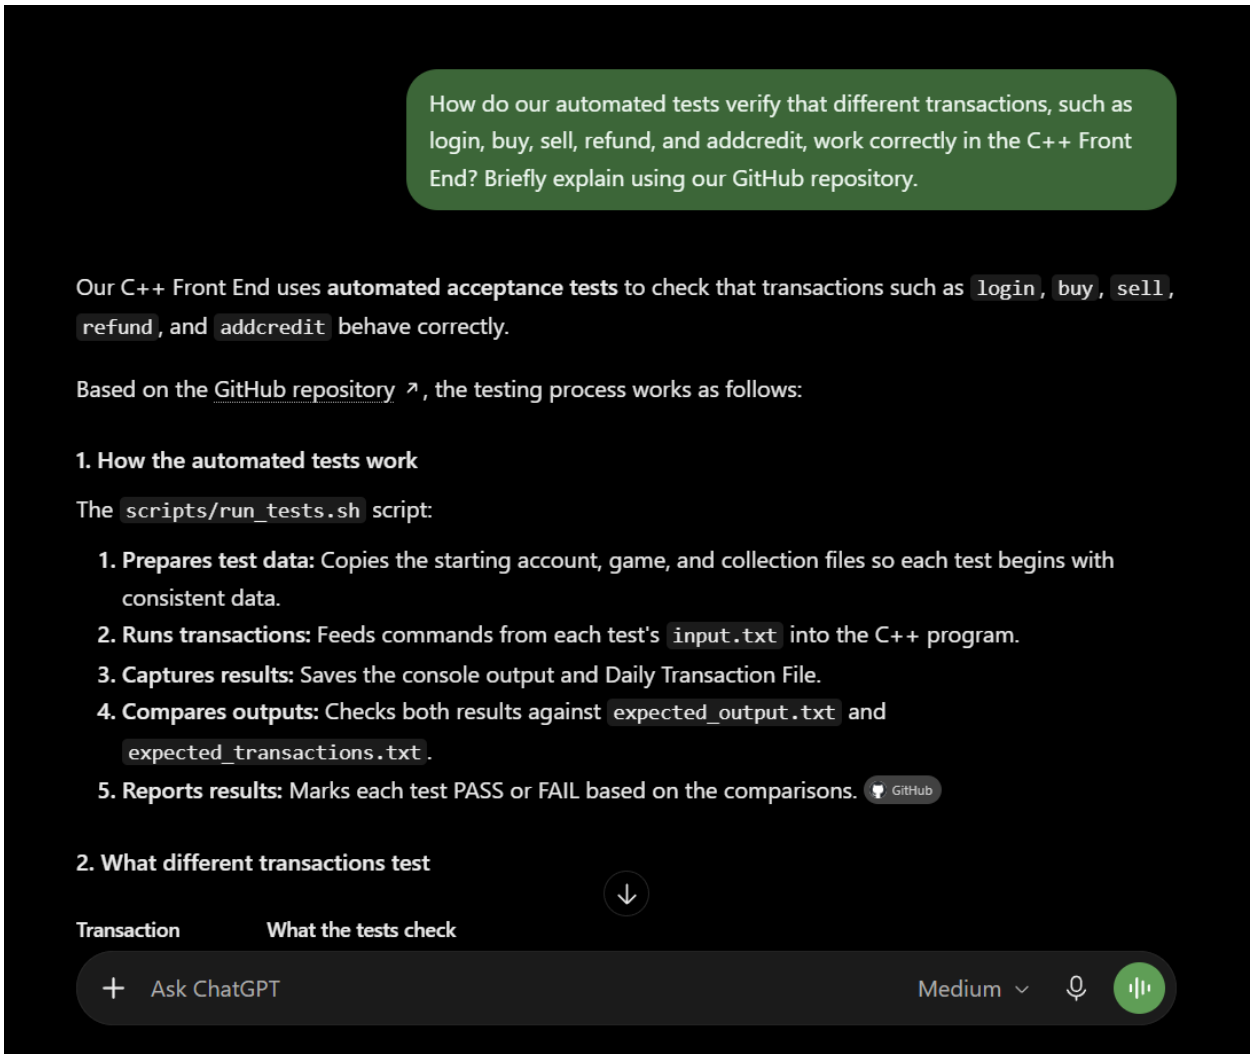

The rest of the response explains what the group should check before submitting the project, including verifying that the C++ Front End is complete, all 17 tests pass, and the failure table is accurate. It also covers ensuring that all required files are committed to GitHub, preparing the final submission files, and including the complete AI usage history.

Prompt 9:
How do the main C++ components in our Digital Games Distribution System Front End work together to process user transactions? Briefly explain using our GitHub repository.
Chatgpt response:

The rest of the response explains how the main C++ components work together to process user transactions. It covers how TransactionFactory selects the appropriate transaction handler, how session management checks user permissions, and how the system manages account and game data. It also explains how DailyTransactionWriter records successful transactions and how separating these components makes the program easier to maintain, debug, and test.

Prompt 10:
How do our automated tests verify that different transactions, such as login, buy, sell, refund, and addcredit, work correctly in the C++ Front End? Briefly explain using our GitHub repository.
Chatgpt response:

The rest of the response explains how automated tests verify transactions such as login, buy, sell, refund, and addcredit using prepared inputs and expected outputs. It covers checking valid and invalid operations, account permissions, credit limits, and transaction records. It also explains how failures are detected by comparing actual and expected outputs and confirms that all 17 tests passed during the final verification.

Summary of AI Usage

The use of AI helped us understand the project requirements, plan the system architecture, organize class responsibilities, and improve our understanding of the C++ Front End. It also provided guidance on transaction processing, session management, file handling, automated testing, debugging, and verifying test results. AI was mainly used for clarification, technical explanations, reviewing our work, and ensuring the project met the assignment requirements.
